

TERAPIX

Meudon, le 27 novembre 2003

TERAPIX

Production of large, “clean” and well-calibrated science images

- Production of calibration/data-description images (weight+flag maps)
- Astrometric and photometric solution
- Image warping
- Image homogenization
- Image co-addition
- Quality assessments

Production of “Final” source catalogs

- Detection
- Measurement
- Classification

Users tools:

- Automatic pipeline / *data base with remote user access*
- vizualisation,
- survey follow-up, etc...

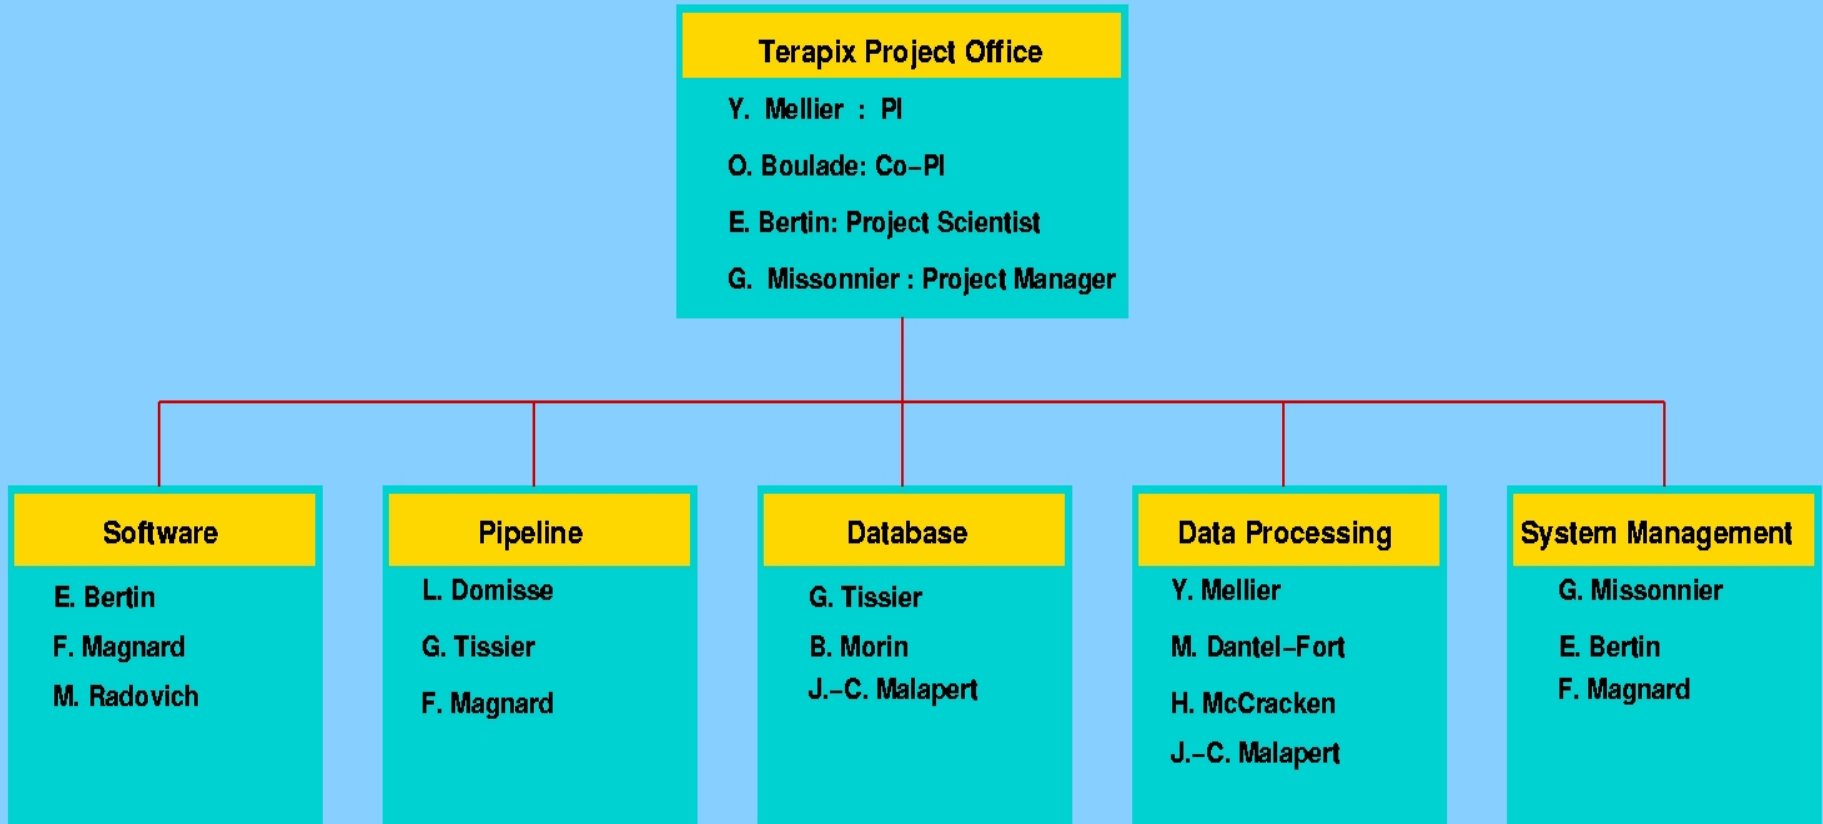

User assistance:

- PI images processed by Terapix
- or PI does their own at Terapix remotely.

Funding:

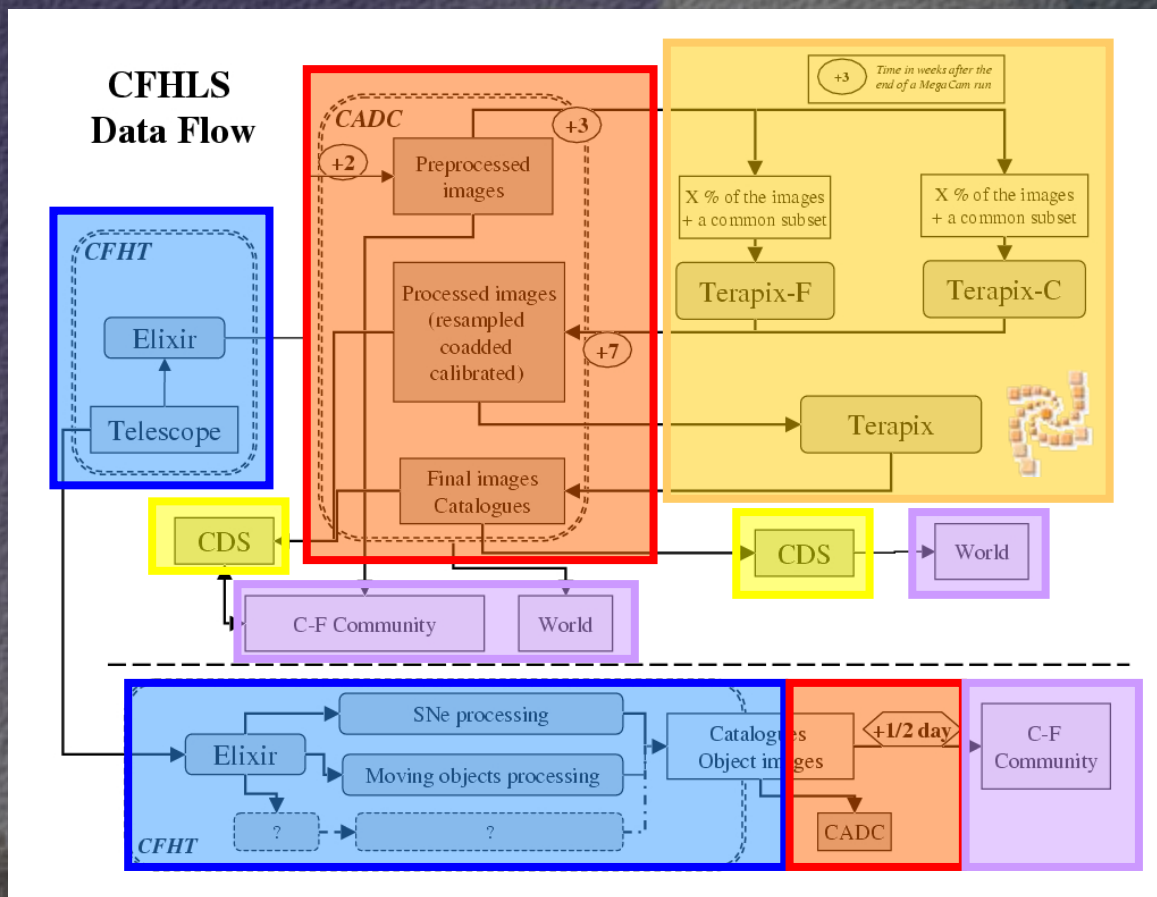

- INSU + PNC + EC-FP5-AVO + EC-FP5-AstroWise + IAP + CEA

Terapix organisation

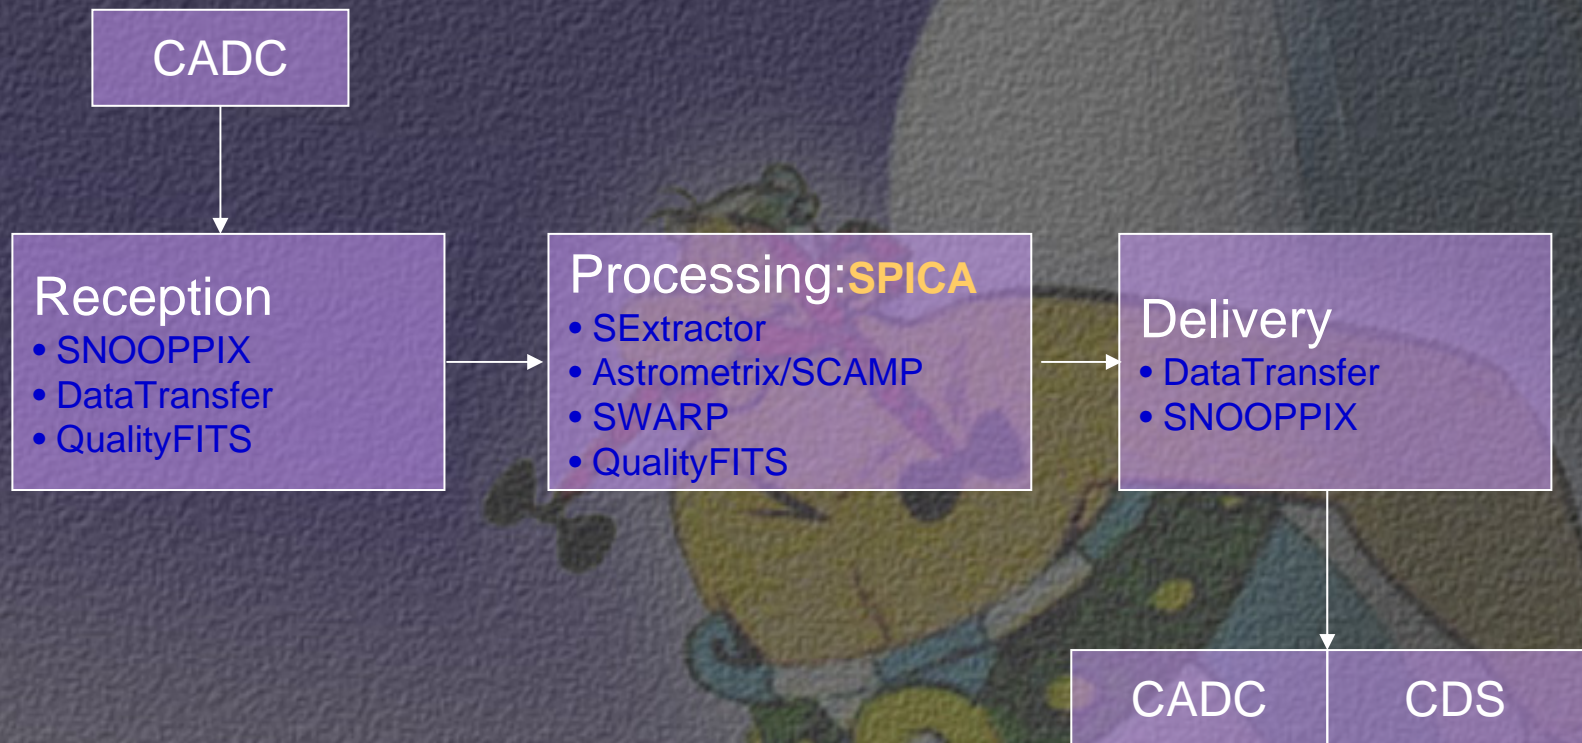

Data Flow

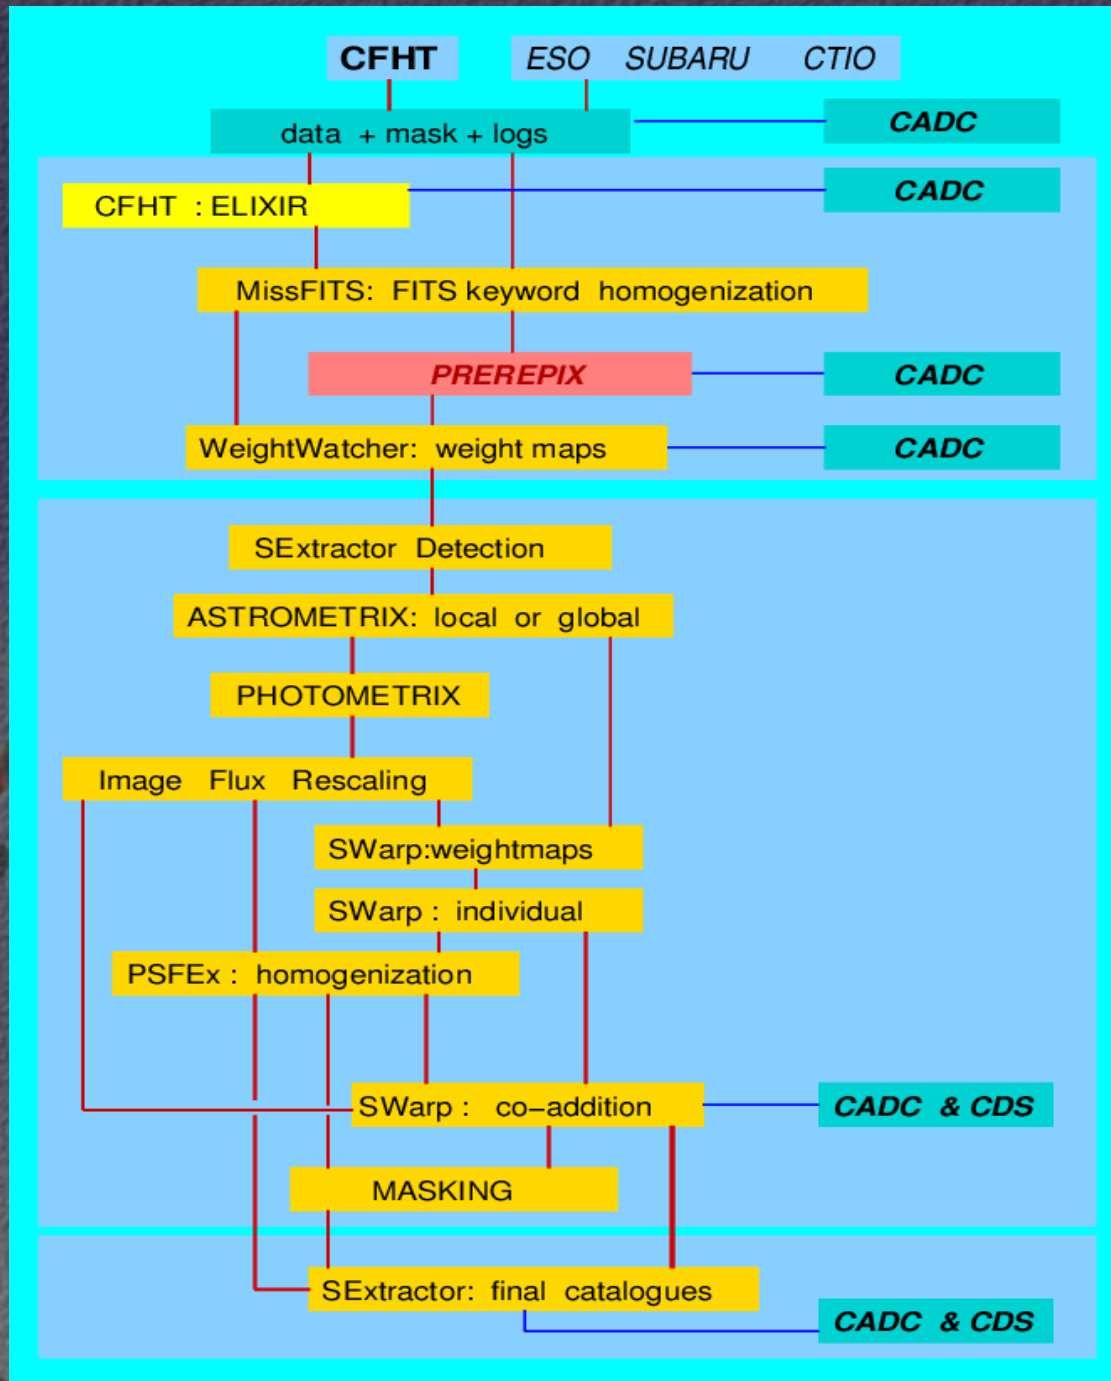

- Terapix reception: 2000-3000 images/run (2.1 TB, maximum) ,
- Terapix production : Weight+Flag images + stacked images (~ 4.5 TB)
- Goals: 300 Kpixel/sec, 100 object/sec (real working time: 8hrs/24)

Overview of the TERAPIX pipeline

Overview of the TERAPIX pipeline

Software

Data reduction modules:

POSIX-compliant C/C++ and/or PDL+PERL-Tk

- **Most of them are being developed and are maintained *on-site* :**
 - Perfectly matched to MEGACAM images
 - Perfect control; fast response in case of problems
 - Many tasks are performed within each module
 - Efficiency (minimizes inputs/outputs)
 - Simplifies the pipeline at higher levels
 - Possible thanks to permanent, dedicated, team members
- **Distributed to the general community A.S.A.D**
 - Tremendously improves robustness and portability (code, instruments, file formats)
 - Brings up new ideas
 - ☺ Helps in forcing people to write a detailed documentation
 - Source packages now comply with GNU standard (Autoconf); binary packages are Linux RPMs
 - Released under GPL

Software (cont.)

Pipeline: stand-alone programs + **SPICA** + **DBclient**

- **SNOOPPIX**: spots data at CADC
- **Datatransfer**: send data to Terapix/CADC and organise data on disks
- **QualityFITS**: input/output quality assessments tools + metadata
- **MissFITS**: manage FITS files
- **WeightWatcher**: Create weight-maps for images
- **SWarp**: Resample and co-add images
- **SExtractor**: Source extraction
- **PSFEx**: Build a PSF model of a field
- **ASTROmetrix/PHOTOmetrix**: local and global astrometry + photometric normalization/calibration
- **SCAMP**: New Astrometric/photometric software

Simulation+visualisation tools: C/C++ stand-alone programs

- **Stuff**: Simulation of galaxy populations
- **SkyMaker**: Image simulation
- **Panorapix**: Large image visualisation
- **Stiff**: image compositing and conversion to TIFF
- **SExBench**: hardware benchmarking software
- **SkyWatcher**: Survey/data sky follow up

SWarp

Updated November 22nd, 2003

SWarp is a program that resamples and co-adds together FITS images using any arbitrary astrometric projection defined in the WCS standard.

The author
▶ Emmanuel BERTIN

Subsections

- ▶ SWarp Mailing List
- ▶ Bulletin Board

<http://terapix.iap.fr/soft/swarp>

What's new?

- ▶ 11/24/2003: A *huge bug* has been found in V2.07. This is now fixed in V2.08. Sorry for the mess.
- ▶ 11/23/2003: Version 2.07 of SWarp is finally available!! Release highlights:

- Resampling is 2 - 10 (!) times faster than in V1.xx
- Multi-threading and co-addition more efficient (code rewritten from scratch)
- Support for BLANK pixels

Download the latest version (V2.08)

Both the autoconfigurable source archive and Linux RPM packages for x86 are available below. The RPM versions have been optimized to provide the best possible performance on Linux PCs.

with :

- Spot the CADC-CFHTLS archive area (Terapix permitted)
- Check data having new Elixired history (new or re-processed by CFHT)
- Get these data to Terapix repository (Fiber Channel Bay). Use ftp or http protocol.

- SNOOPPIX has been cloned at CADC to get Terapix-ed data from the Terapix repository to CADC

Transfer the data snooped by SNOOPPIX from the data transfer repository disks to Terapix processing disks

Check the disk space available on each node and send the data on disks that still have enough space to produce weight + flag map images

Make statistics on images (period, RunID, filter, etc...) and store meta-data on local DB

Can run automatically or manually

Data transfer - progress report

QualityFITS

Delivered by Terapix to the AstroWISE consortium

Provides a complete image analysis of all images

- Check background
- Maps the PSF
- Checks star and galaxy counts
- Produces weight/flag maps

Quality assessment for in/out images

QualityFITS uses:

- SExtractor
- PSFex
- SWARP
- PLplot library tools
- Weightwatcher

Evaluation of 708710o

Pipeline SPICA : PHP/SQL technologies

« web » interface

- Fully portable, used remotely
- Users accounts
- Selection criteria included for user selection of images and configuration files
- Fully automated mode (all images)

Spica administration

configuration

Should be located in a restricted area
(Version 0.01)

Config files

[Make configuration files](#)

You could use as many configuration files as you need.

[Modify configuration files](#)

Use this part if you just need to change some values in your configuration files. This part will load your current data and will allow you to change the values.

[Make from previous files](#)

If you need to get several configuration files but nearly similar, use this to load an existing configuration file, modify it and save it with another name.

[Delete configuration files](#)

If you want to delete some of your configuration files, this is the right place. Be careful as there is no way to restore them.

Global astrometric solution

Uses both overlapping detections and a reference astrometric catalog (**USNO**): automatic access to CADC catalogs

Works best with a wide dithering pattern

Current method (**Astrometrix**): iterative solution... **SCAMP** used for Megacam images

No need to bring coordinates to a common projection

Megacam CFHTLS Wide: Pre-survey

$$\chi^2 = \sum_{i < j, k \in \Omega_i \cap \Omega_j} \frac{(x_{ik} - x_{jk})^2 + (y_{ik} - y_{jk})^2}{\sigma_{ik}^2 + \sigma_{jk}^2} + \lambda \sum_{i, k \in \Omega_0} \frac{(x_{ik} - x_{0k})^2 + (y_{ik} - y_{0k})^2}{\sigma_{ik}^2 + \sigma_{0k}^2}$$

Image resampling and co-addition:

SWarp

- **FITS/WCS/TNX** in input and output (thanks to a modified version of **M.Calabretta's WCSLib v2.6**)
- Full handling of weight-maps
- Work with arbitrarily large images
- Up to 9 dimensions (including a maximum of 2 spherical coordinates)
- Choice of interpolation functions (kernels up to 8ⁿ taps)
- Equatorial/Galactic/Ecliptic coordinates
- Built-in background subtraction and noise-level measurement for automatic pixel weighting
- Automatic centering/sizing of the output field
- Multithreaded
- Speed: typically 500kpix/s on a bi-proc Athlon @1.5GHz

Some projections supported in **Swarp**

Weighted co-addition

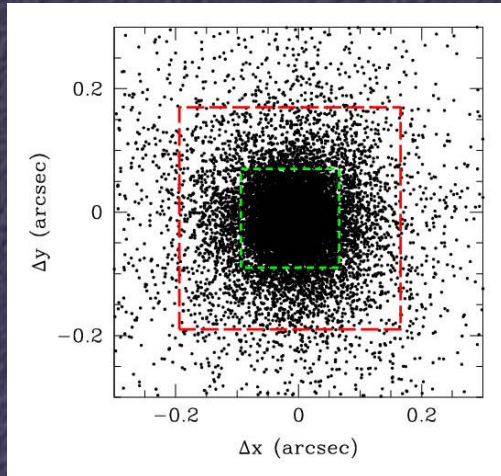

Application to Megacam:

**SDDS vs. Megacam star
color-color diagram**

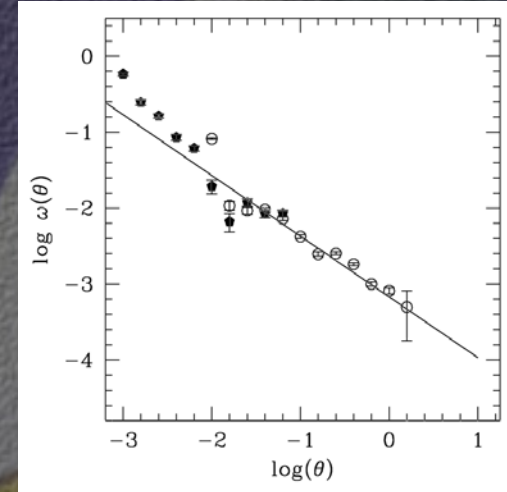

**18 x 560 sec. r' + 17 x
560 g' + 13 x 700 sec. u^*
Megacam data**

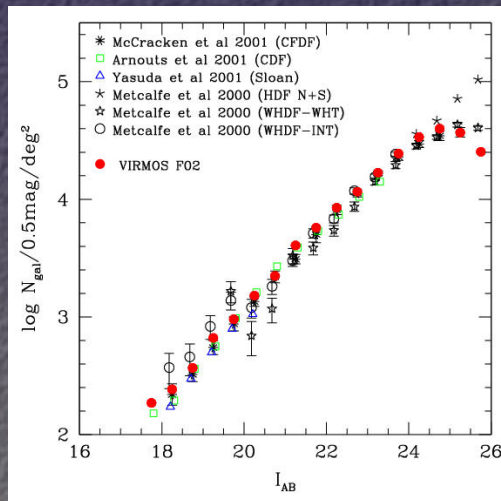

Scientific applications as test bench for Terapix

Astrometry

Photometry: 2-pt galaxy correlation function

Photometry: galaxy counts

Photometry: galaxy color-color tracks

VIRMOS/TERAPIX teams: McCracken et al. 2003

Performances

Configuration

- ☞ Datatransfer + QualityFITS + SPICA (detection, astrometry, warping, co-addition, QualityFITS-out) + DB storage
- ☞ 10 Bi-proc nodes working

Performance

- ☞ Data transfer CADC to Terapix: ftp : 20 Megacam (compressed) images/hr
- ☞ 1000 Megacam images Nov. 2003: 250 hrs (expected soon: 200 hrs): 30 working days (~ 8hrs/day)

Expected input flow

- ☞ Big Megacam run: 10 hrs/night; 15 nights, 5min. Exp. Time: 1800 images
- ☞ We are almost ok, but we must think about re-processing: better software tools; faster and more reliable nodes and CPUs; more optimised compilation options

On going developments and prospects

- Image masking
- PSF homogenization
- Improve/increase quality assessment tools
- Image visualisation: Panorapix
- Survey follow up tools: skywatcher
- Prepare WIRCAM tools, if needed

- More complex and precise galaxy morphology analysis

End
