

REST-FRAME COLORS BIMODALITY IN VVDS GALAXIES

THE METHOD

GRID OF TEMPLATES

Reduced χ^2 computation

$$\bar{\chi}^2 = \frac{1}{d} \sum_{i=1}^N \left(\frac{F_{i,obs} - F_{i,sim}}{\sigma_i} \right)^2$$

Best χ^2 model

- Model parameters => Galaxy parameters
- Model \times Normalization factor => SED => Absolute rest frame magnitude
Absolute rest frame colors
- Model stellar mass \times Normalization factor = Galaxy stellar mass

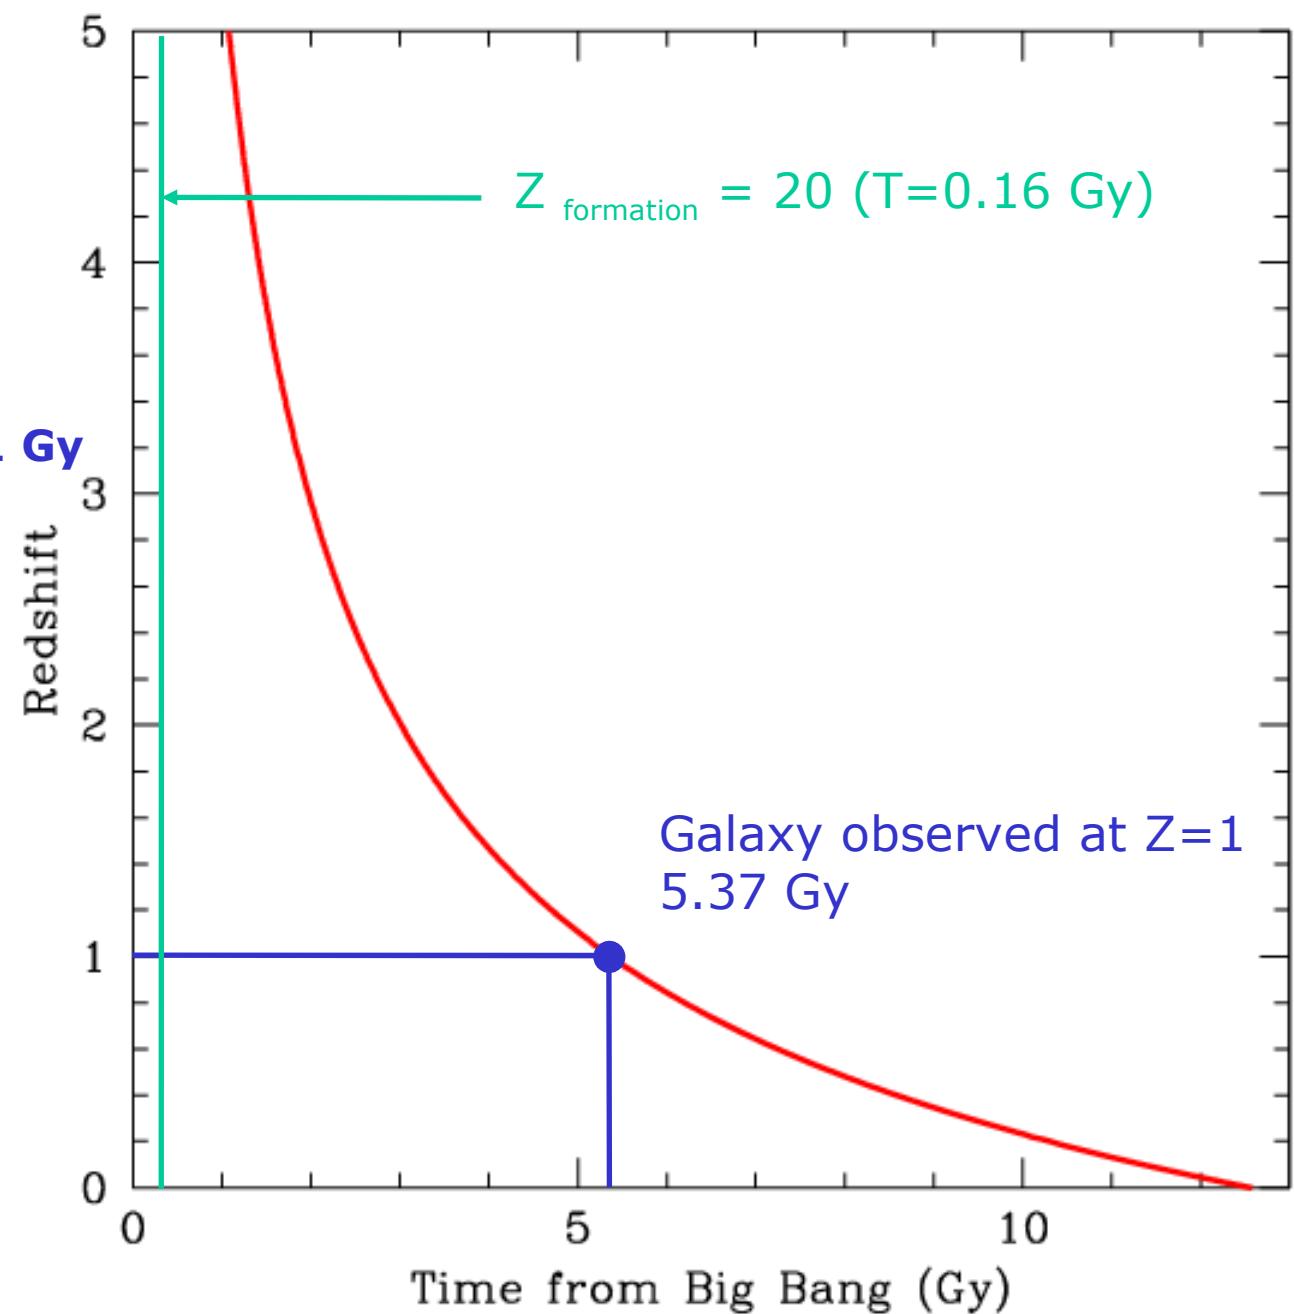

THE METHOD

1 BestFit approach

All ages up to 5.37 Gy

2 FixedAge approach

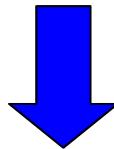

Age = 5.37 - 0.16 = 5.21 Gy

COLOR BIMODALITY

FIRST SAMPLE

- High continuum intensity
- High signal to noise
- Low photometric errors on magnitudes

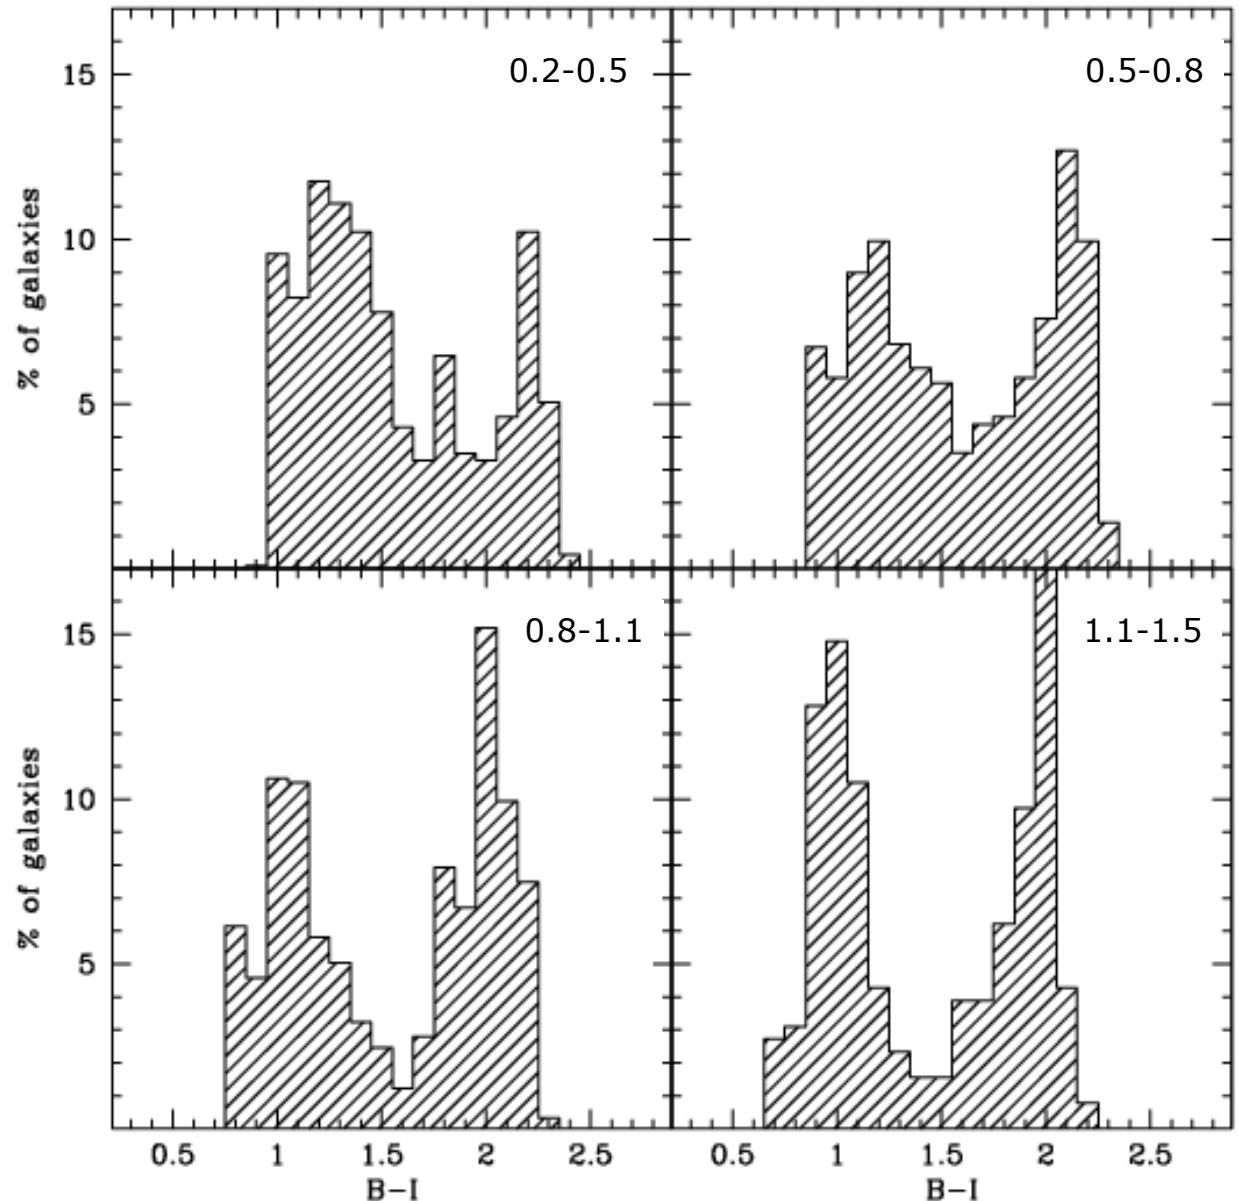

$0 < z < 1.5$

$I_{AB} < 23$

No Flag 1 objects

3498 galaxies

FixedAge $I_{AB} < 23$

COLOR BIMODALITY

CURRENT SAMPLE

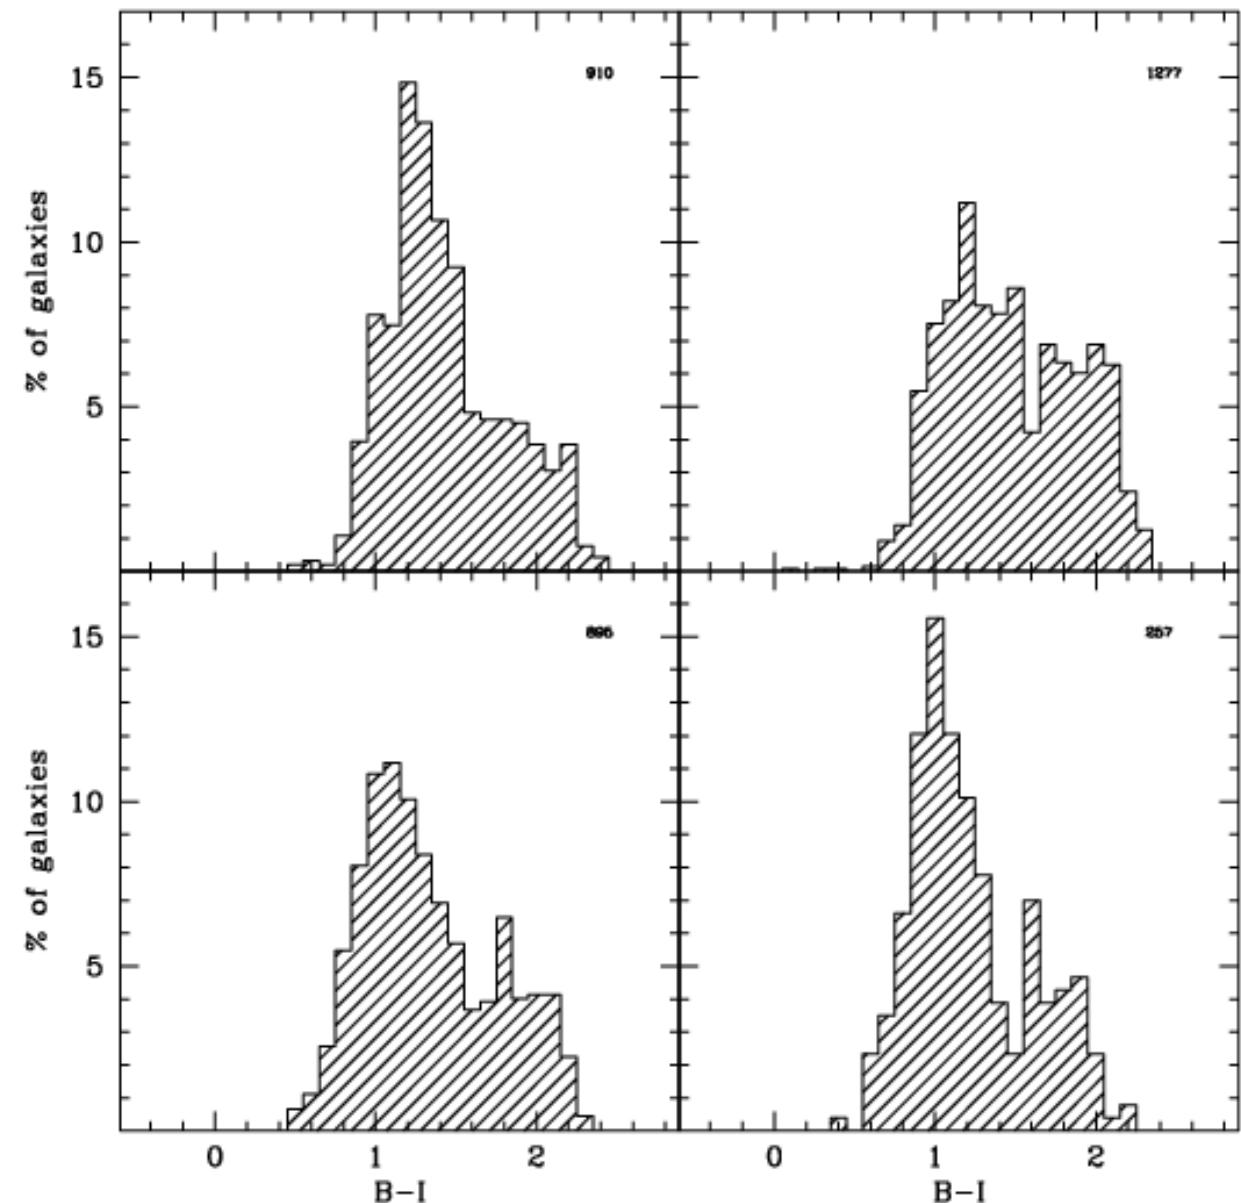

$0 < z < 2$

$I_{AB} < 24$

No Flag 1 objects

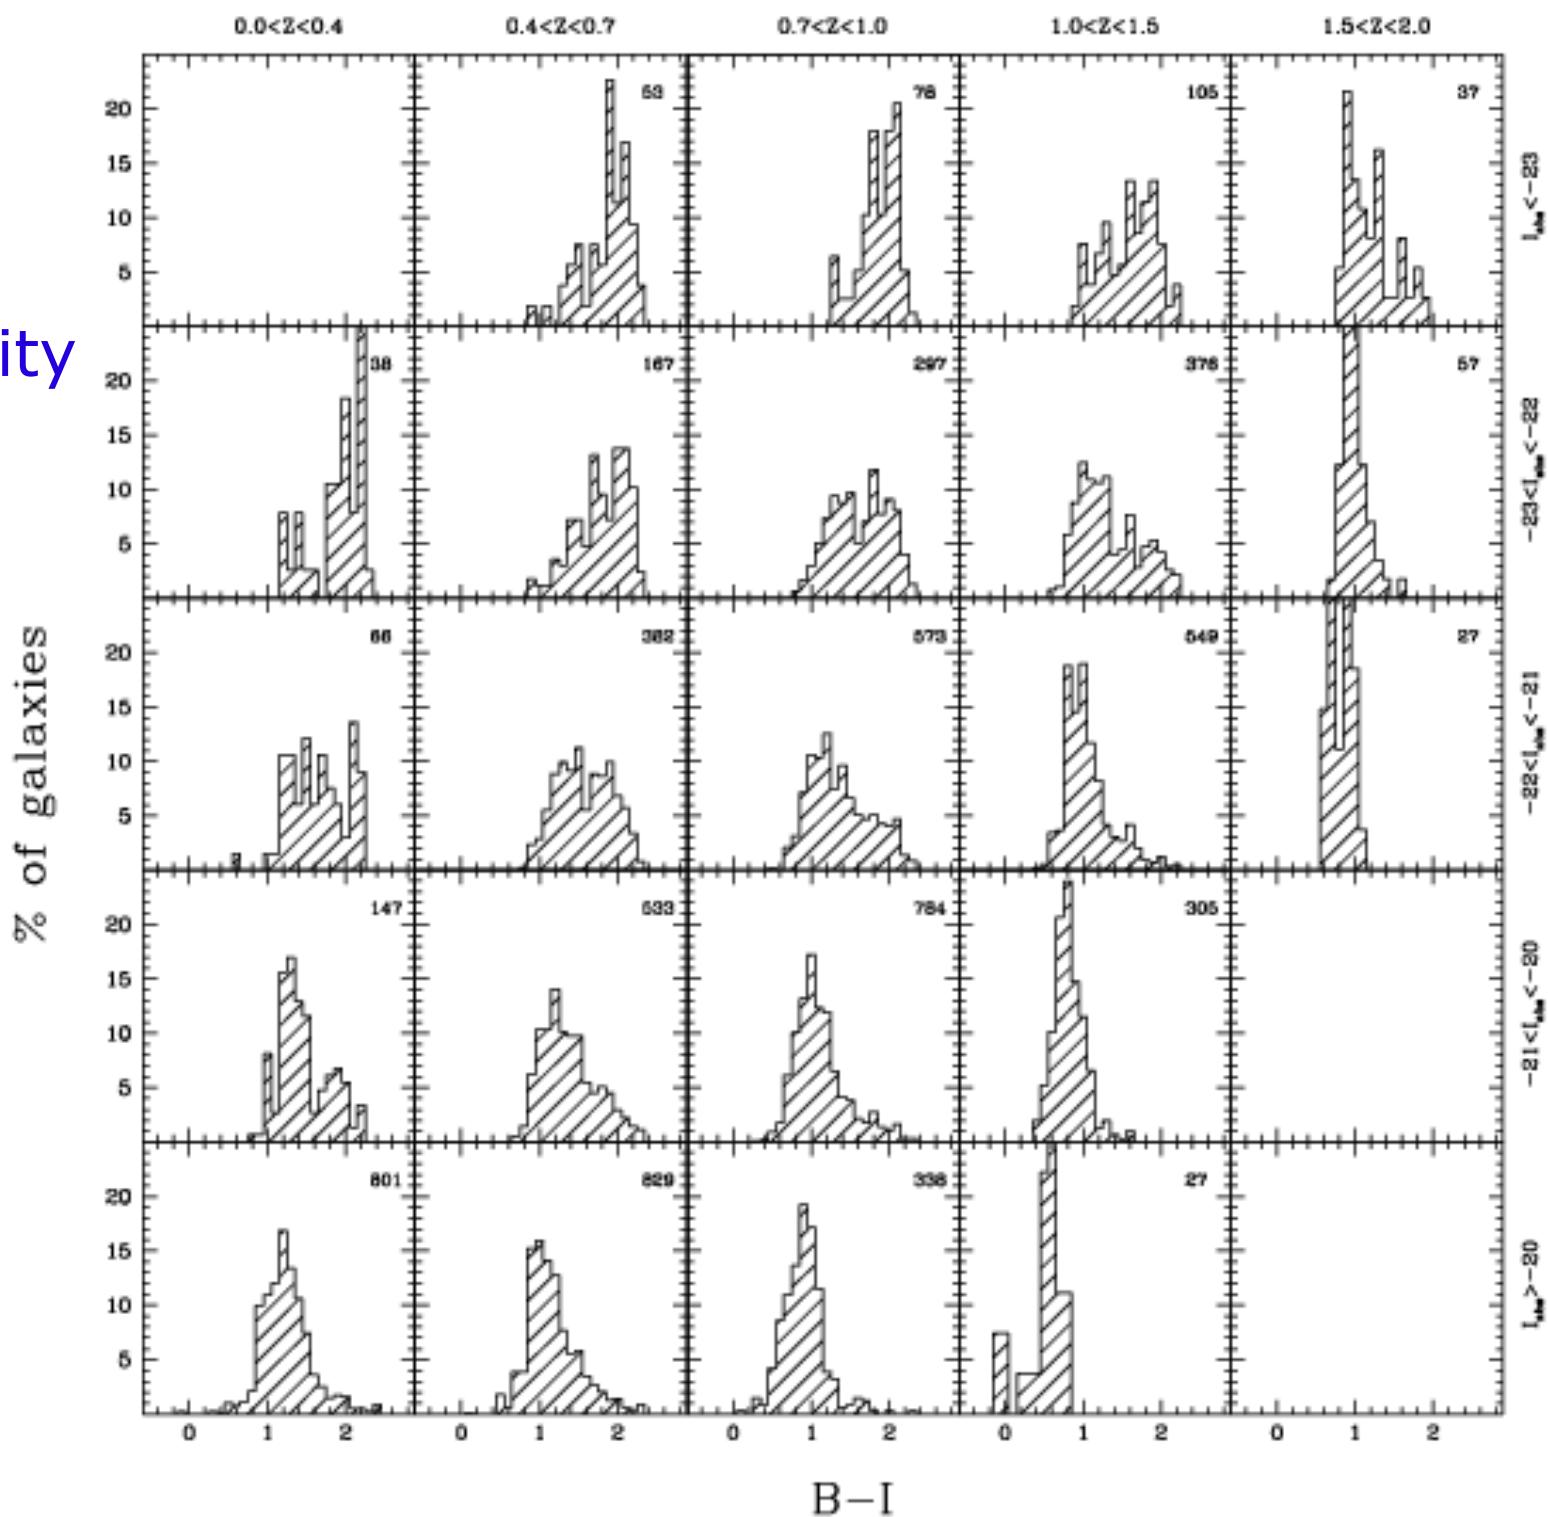

6601 galaxies

BestFit $I_{AB} < 23$

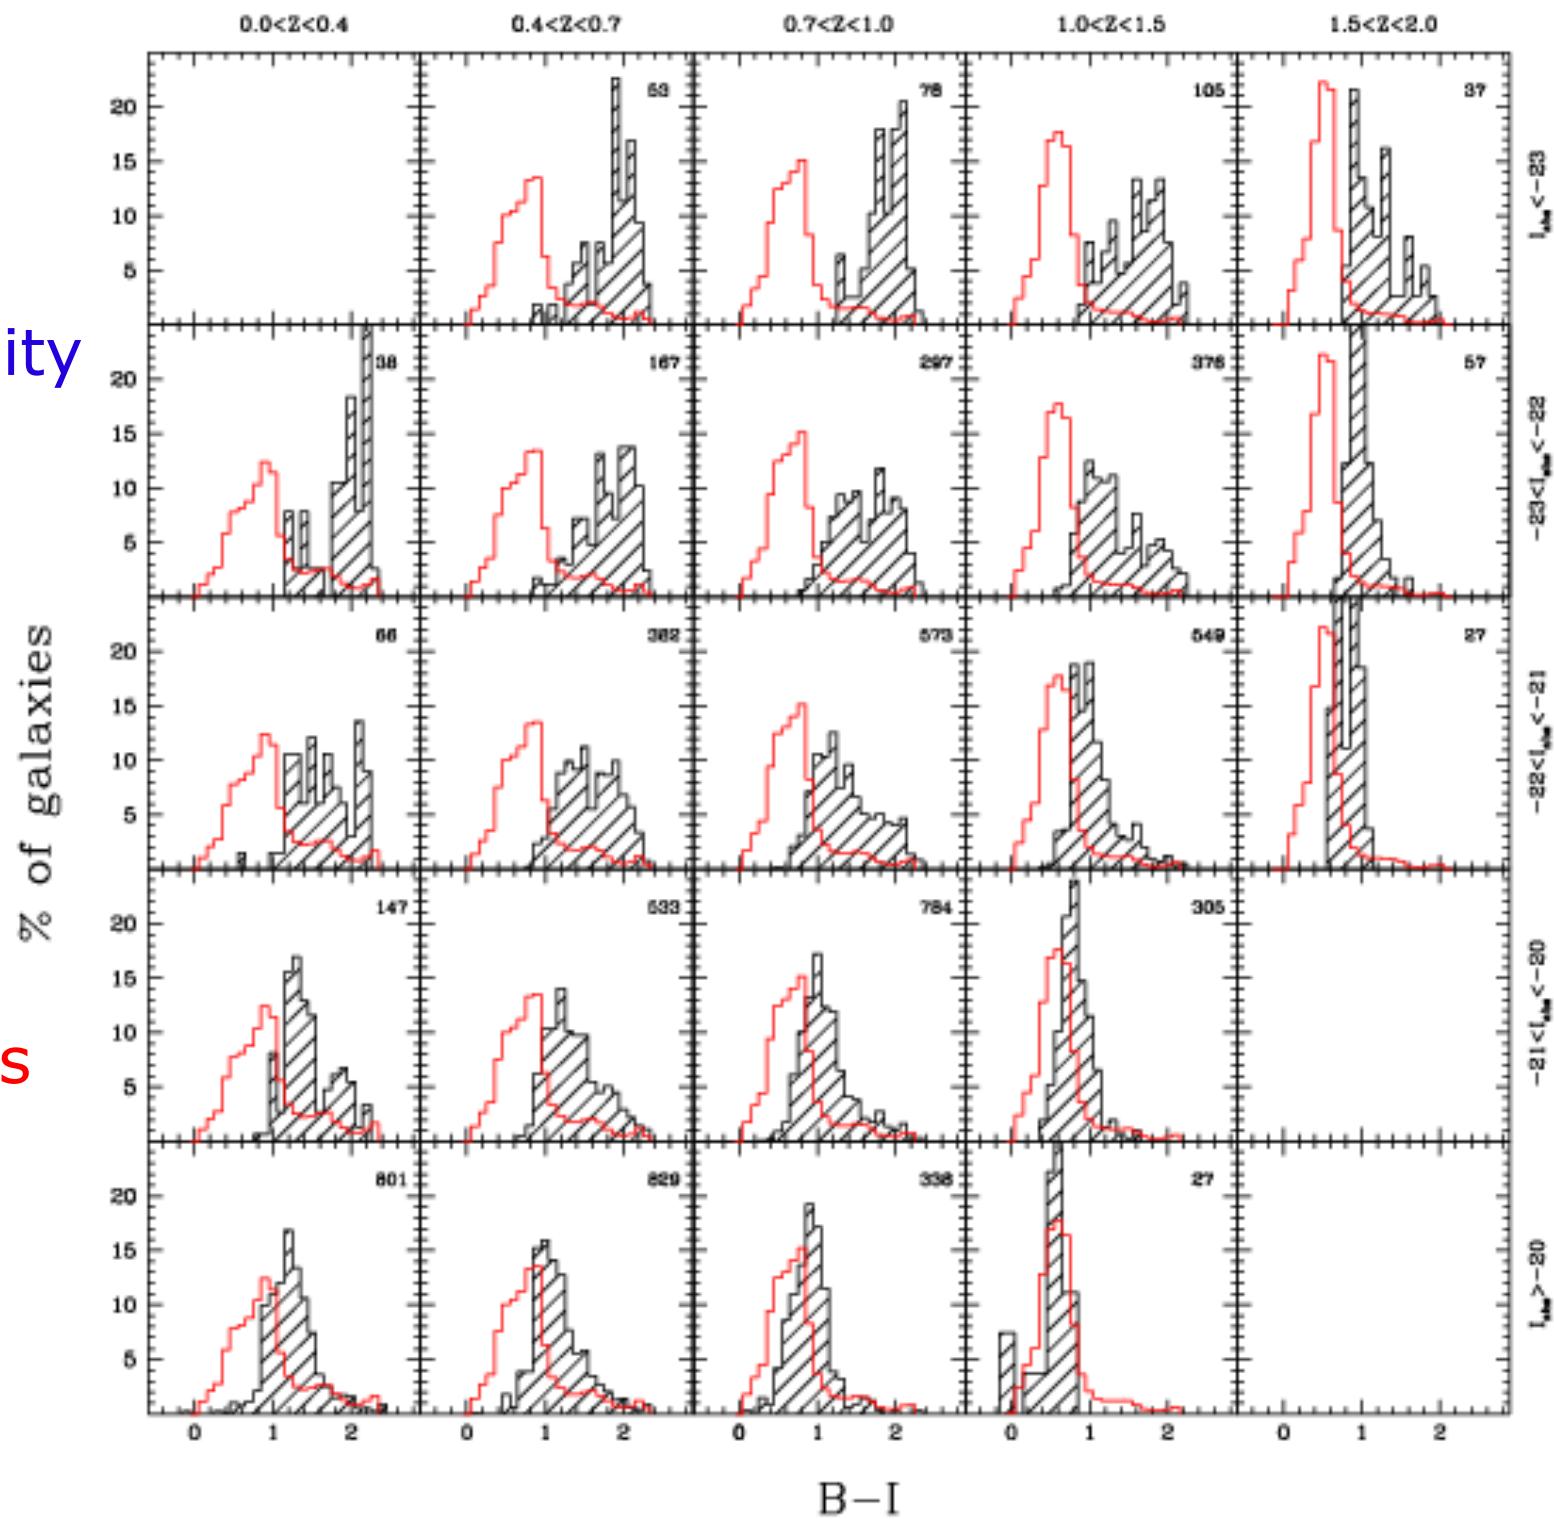

COLOR BIMODALITY

Bins in redshift
& bins in luminosity

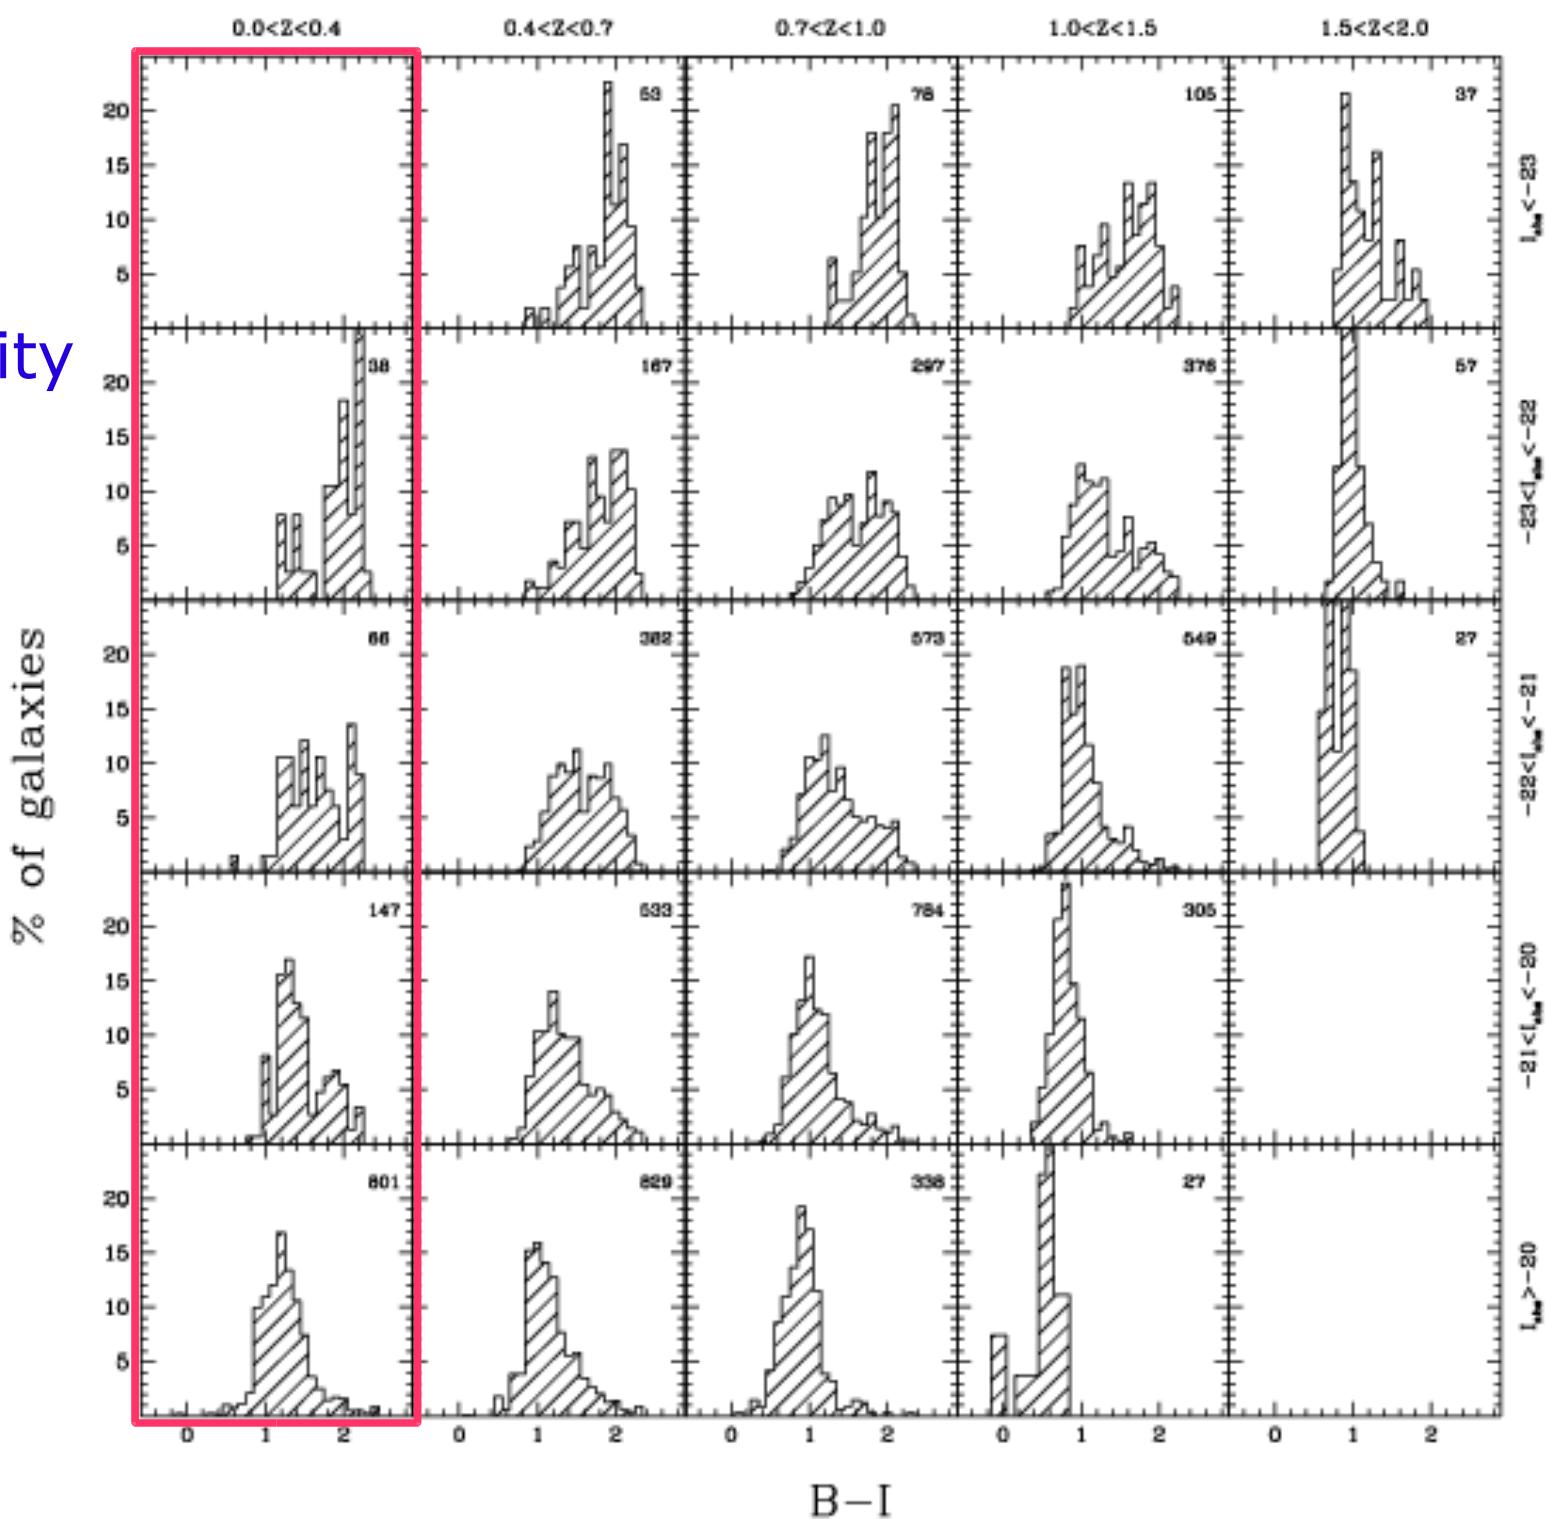

COLOR BIMODALITY

Bins in redshift
& bins in luminosity

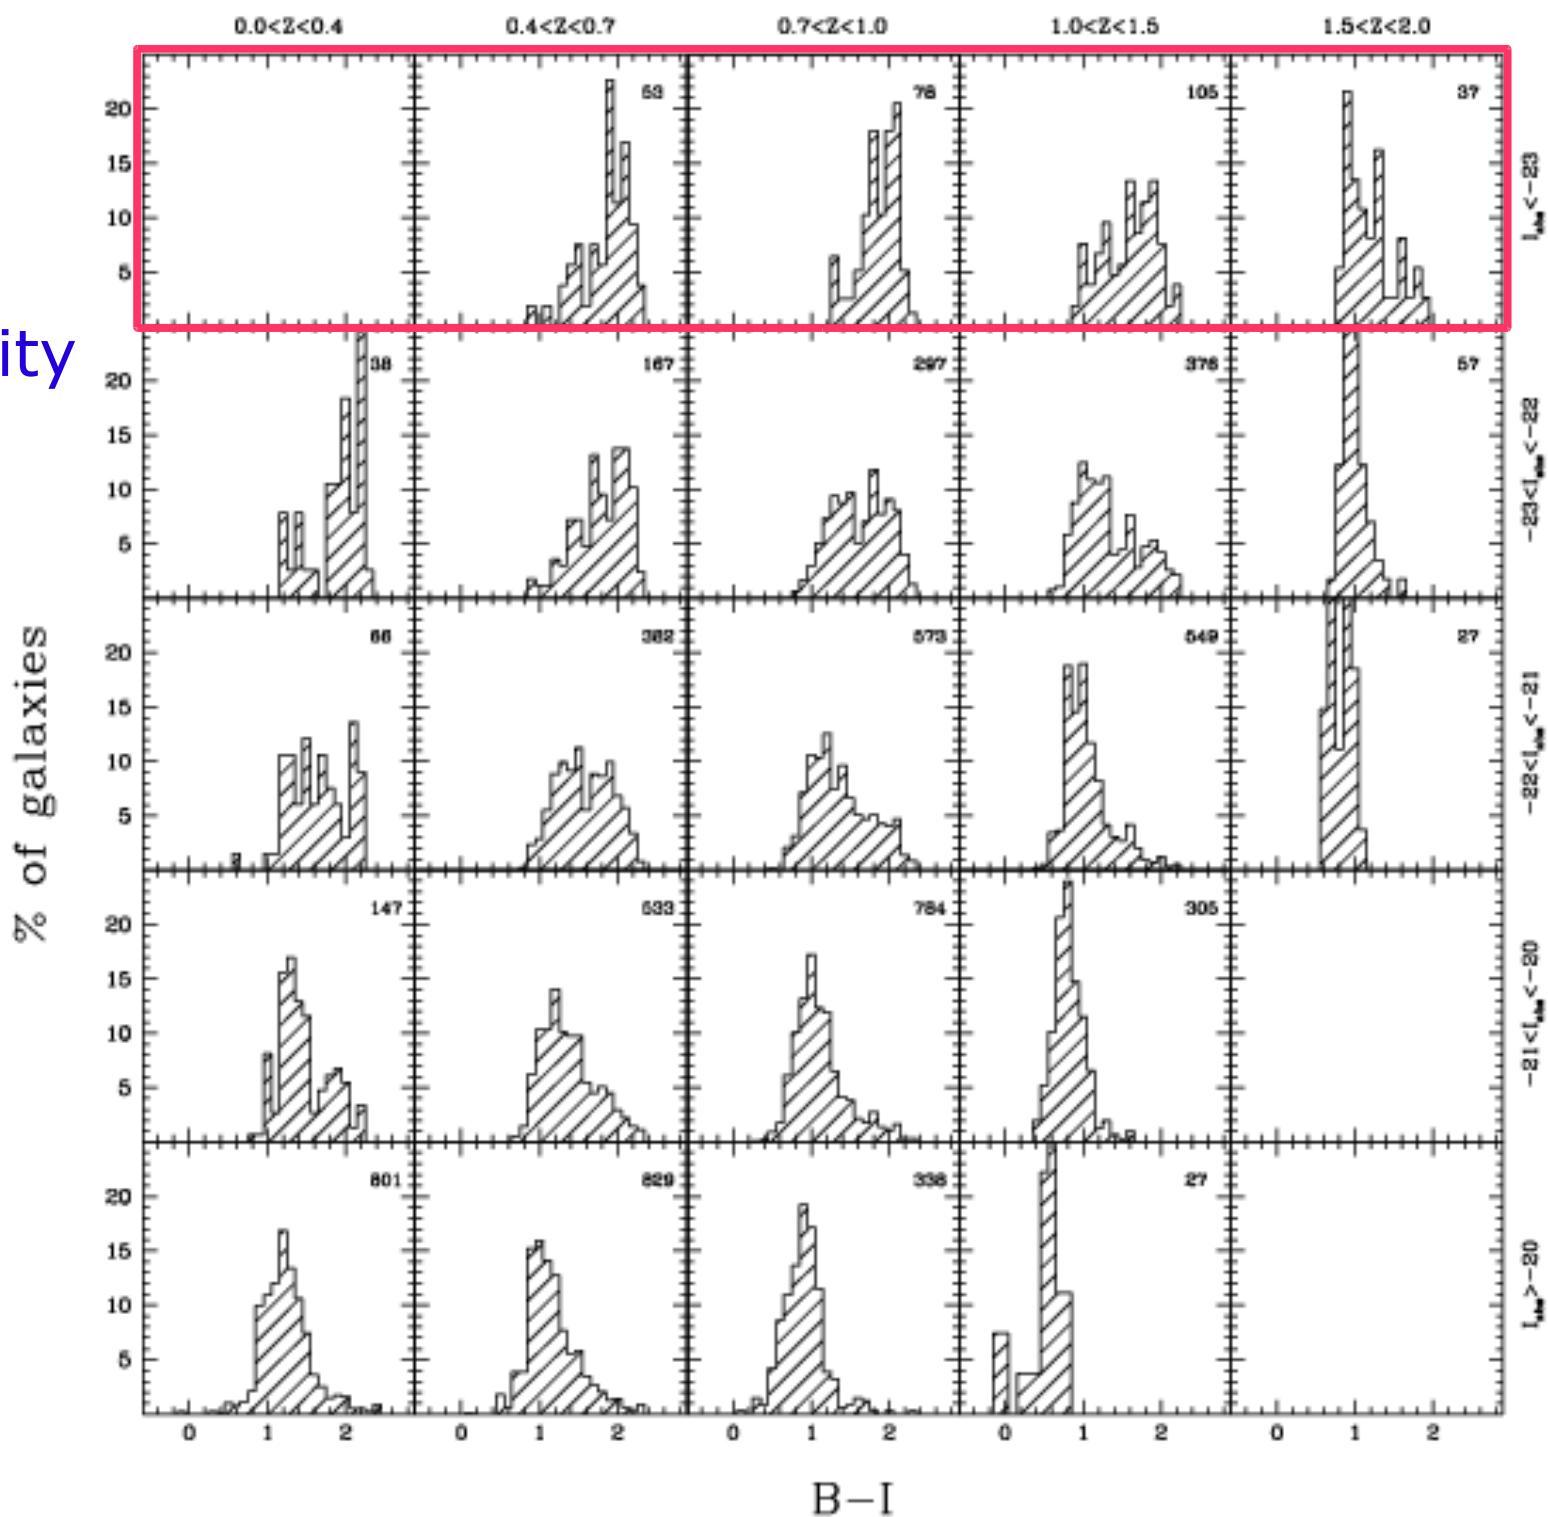

COLOR BIMODALITY

Bins in redshift
& bins in luminosity

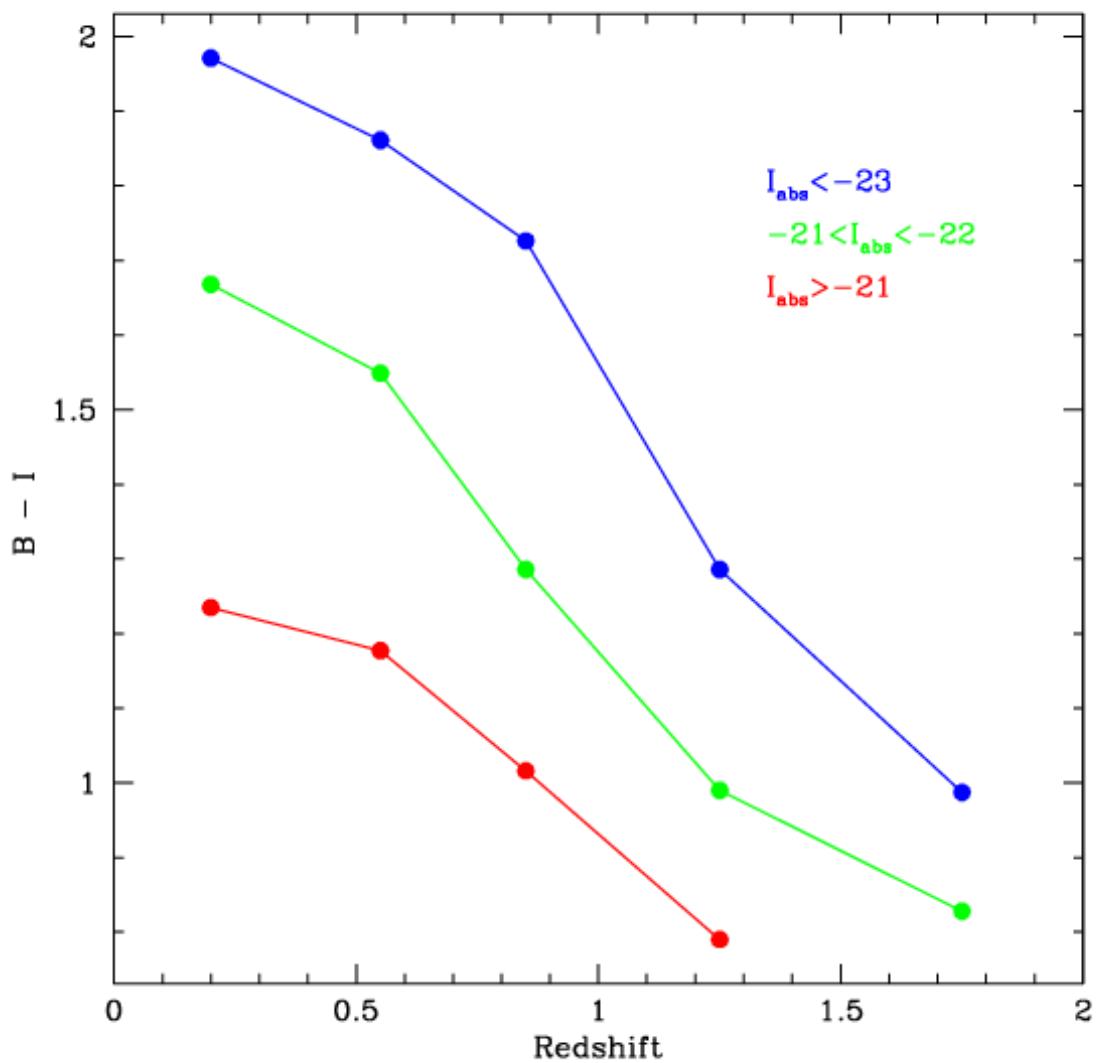

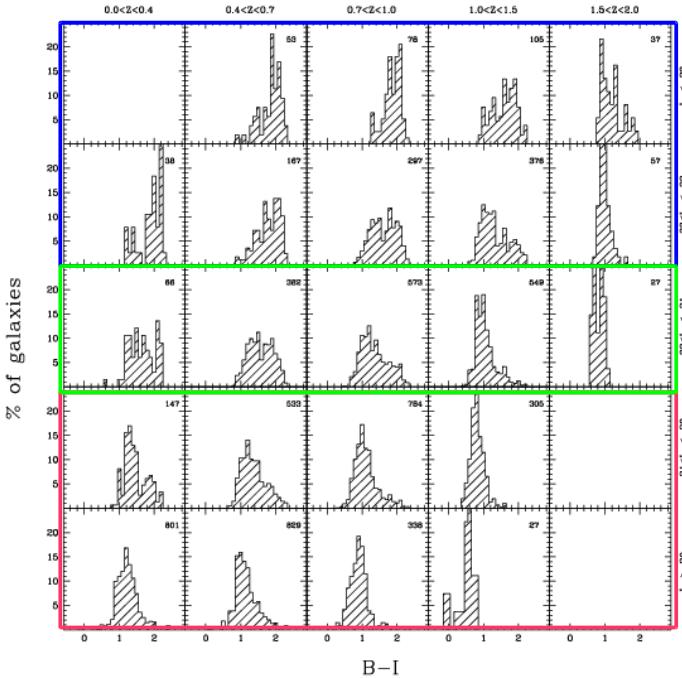

COLOR BIMODALITY

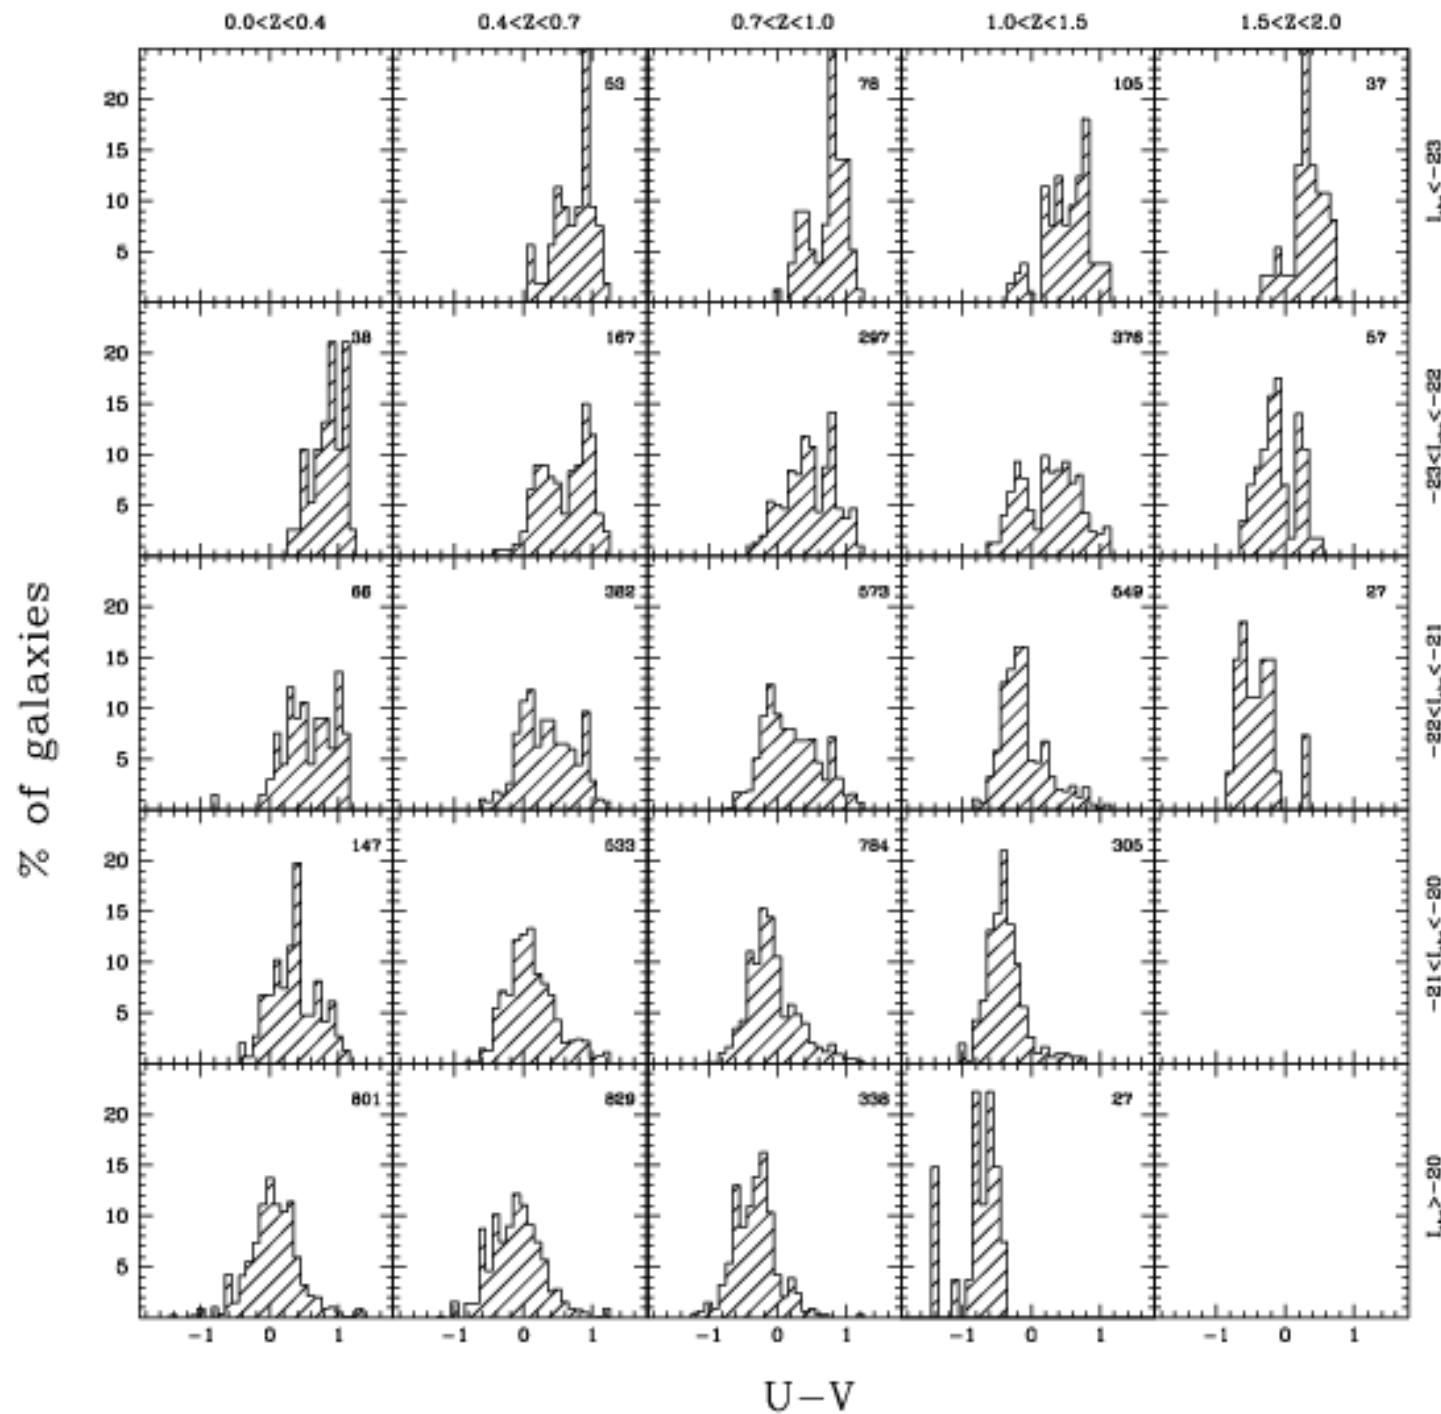

Bins in redshift

COLOR BIMODALITY

COLOR BIMODALITY

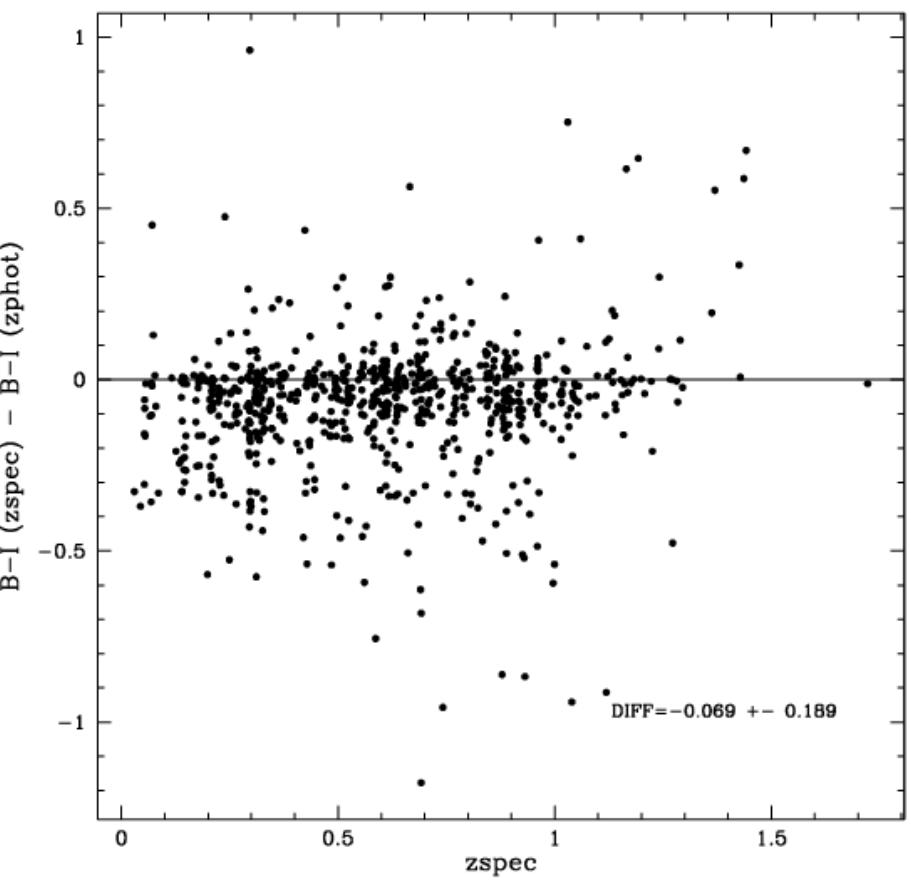

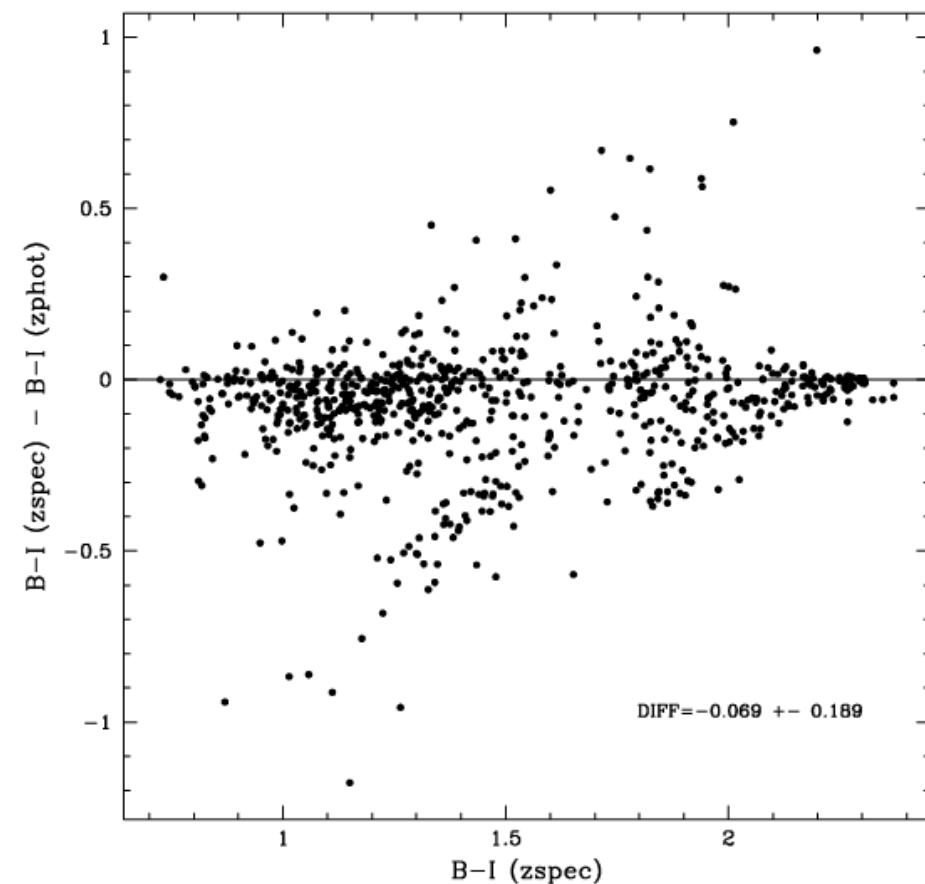

COLOR BIMODALITY

FUTURE DEVELOPMENT

- Enlarge the sample using z_{phot}

751 (out of 6601) objects with the best available z_{phot}

FUTURE DEVELOPMENT

- Enlarge the sample using z_{phot}
- Quantify the difference in the bimodality of different colors
- Check the bimodality against other quantities (density)
- Weights?
-
